

E-mail Alerts

DialogLink 5

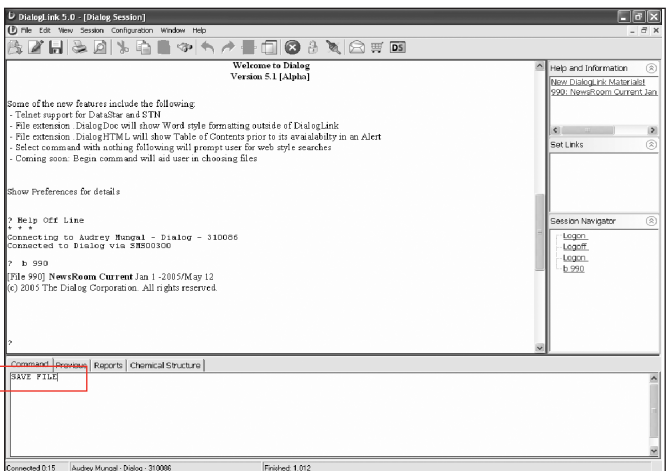

DialogLink 5 lets you customize Alerts using DialogLink 5 templates in Microsoft® Word via Extensible Style Sheet Transformations (XSLTs). These templates can be modified to transform XML (Extensible Markup Language) content into HTML for customizable Alerts. Using these Custom E-mail Alerts, you can create a professionally formatted Alert that is delivered via HTML. You also can choose to include a table of contents that lists all relevant records at the top.

In this example, a Custom E-mail Alert is created for Dialog NewsRoom Alerts. Should you need help in completing any steps, please contact your training or application specialist or the Dialog Knowledge Center.

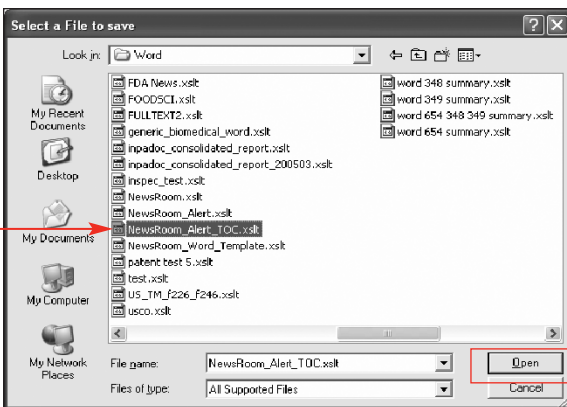

1. In the Configure Word Report window, add **<ToC>** and **<H1>** tags to the NewsRoom Microsoft Word template so that template will work for both Word reports and Alerts. Type **SAVE**.

2. Upload the template using the **SAVE FILE** command.

3. Locate your template.

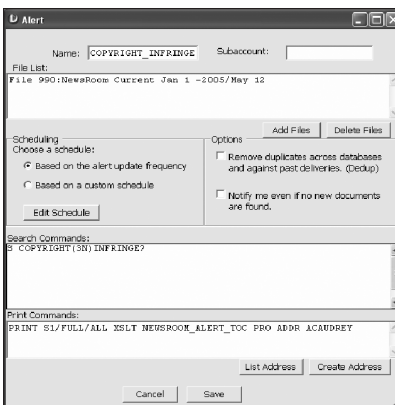

4. Click **Open**.

5. Click **Save**. The filename must not have any spaces. Use underscores instead.

6. Use the **RECALL FILE** command to review available templates.

7. Develop or edit your Alert strategy. Your PRINT statement will have the syntax: **PRINT Sx/Format/Range XSLT Template_Name Address.** (Example: PRINT S7/FULL/ALL XSLT BIOMED_WORD REDIST 100 ADDR MYADDRESS)
